

CERA-MAT

Gloss reduction

Surfaces that make an elegant impression

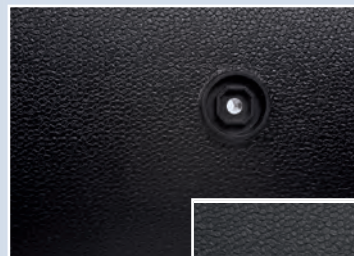

Every advantage at a glance:

- Shorter processing times than other coating methods
- Layer thicknesses up to 15 µm
- Performs with low draft angles
- Lower coating temperature means no thermal impairment of tool steel
- Coatings can be flexibly adjusted to fit the requirements of plastics.
Possibility of graduated coating
- Can be applied on existing tooling for optimisation
- Coating can easily be removed – There are hardly any limitations on repairs
- There are few limitations on tool dimensions
- Suitable for typical cleaning agents – We'll be happy to help you choose one product
- and many more

For dazzling product sales!

Developed by Eschmann Textures International GmbH based on our proprietary CS technology, Cera-Mat is a flexible coating system which improves the finish of injection moulded parts. This technology can significantly reduce shine to a nearly lacquer-like finish without changing the basic surface structure in the slightest. Cera-Mat can enhance or completely replace conventional gloss-reduction processes like Eschmann Texture's MatDown.

Two identical components with different surface impressions. The surface treated with Cera-Mat (lower) appears more elegant and high-quality from the first glance.

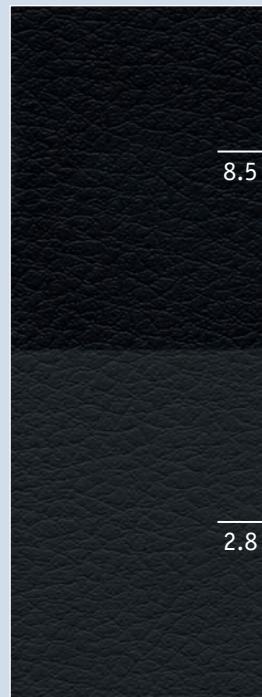

Elegance you can see and feel!

Often, it's at the first glance and the first touch that we decide how we feel about an interior.

Use Cera-Mat to create elegant product finishes that look sophisticated and high-class.

Tools coated with Cera-Mat are easy to protect from corrosion using a VCI powder.

Visit our website at www.eschmanntextures.de for more information about these technologies and to download the safety data sheets. We'll be happy to assist you.
